<sup>(a)</sup> Los estándares que se muestran pertenecen a las Lineamientos para la Salud Humana del Consejo Canadiense de Ministros del Ambiente (CCME) para terrenos residenciales (TR) y tierras agrícolas (TA)  
Los factores propios del área incluyen: i= ingestión de suelo; c = contacto con el suelo; n = provisional; d = contacto directo; p = provisional  
<sup>(b)</sup> Cuando no se contó con un estándar de CCME aplicable, se utilizó los Niveles de Análisis de Suelos Residenciales Regionales para Contaminantes Químicos en Sitios del Superfondo (Sept, 2008) del Laboratorio Nacional de Oakridge (se ajustó las lineamientos para que reflejen un ILCR de 10-5, un HQ de 0.2)  
\* B[a]P TPE – Equivalentes totales de potencia es la suma de la potencia cancerígena estimada relativa a B[a]P usando los siguientes factores de equivalencia de potencia: benz(a)antraceno = 0.1, benzo(a)pireno = 1; benzo(b)fluoranteno = 0.1; benzo(k)fluoranteno = 0.1; criseno = 0.01; benzo(g,h,i)perileno = 0.01; dibenz(a,h)antraceno = 1; indeno(1,2,3-c,d)pireno = 0.1. Cuando no se detectó un parámetro, se utilizó la mitad del límite de detección.  
< = Menor a la concentración mínima detectable

|            |                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>500</b> | en negrita y subrayado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales |
| <b>500</b> | subrayado/en cursiva indica que las concentraciones son mayores que los estándares de suelos urbanos de Panamá                                              |
| <i>500</i> | en cursiva indica que el límite de detección del método es mayor que las lineamientos del CCME                                                              |

Nota: Todas las unidades están en miligramos por kilogramo (mg/kg) a menos que se indique de otro modo

| B[a]P TPE                                                                        | µg/g     | 5.3                                                               |       |                                           |                     |           |        |           |              |        |

<sup>(a)</sup> Los estándares que se muestran pertenecen a las Lineamientos para la Salud Humana del Consejo Canadiense de Ministros del Ambiente (CCME) para terrenos residenciales (TR) y tierras agrícolas (TA)

Los factores propios del área incluyen: i= ingestión de suelo; c = contacto con el suelo; n = provisional; d = contacto directo; p = provisional

<sup>(b)</sup> Cuando no se contó con un estándar de CCME aplicable, se utilizó los Niveles de Análisis de Suelos Residenciales Regionales para Contaminantes Químicos en Sitios del Superfondo (Sept, 2008) del Laboratorio Nacional de Oakridge (se ajustó las lineamientos para que reflejen un ILCR de 10-5, un HQ de 0.2)

\* B[a]P TPE – Equivalentes totales de potencia es la suma de la potencia cancerígena estimada relativa a B[a]P usando los siguientes factores de equivalencia de potencia: benz(a)antraceno = 0.1, benzo(a)pireno = 1; benzo(b)fluoranteno = 0.1; benzo(k)fluoranteno = 0.1; criseno = 0.01; benzo(g,h,i)perileno = 0.01; dibenz(a,h)antraceno = 1; indeno(1,2,3-c,d)pireno = 0.1. Cuando no se detectó un parámetro, se utilizó la mitad del límite de detección.

< = Menor a la concentración mínima detectable

|     |                                                                                                                                                             |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 500 | en negrita y subrayado indica que las concentraciones son mayores que las lineamientos para la salud humana del CCME respecto de los terrenos residenciales |
| 500 | subrayado/en cursiva indica que las concentraciones son mayores que los estándares de suelos urbanos de Panamá                                              |
| 500 | en cursiva indica que el límite de detección del método es mayor que las lineamientos del CCME                                                              |

Nota: Todas las unidades están en miligramos por kilogramo (mg/kg) a menos que se indique de otro modo

<sup>(a)</sup> Basado en los criterios definidos en Golder (2007): Proyecto Petaquilla – Revisión de la calidad del agua de parte de los reguladores.

<sup>(b)</sup> En los cálculos estadísticos se utilizó un valor de la mitad del límite de detección.

<sup>(c)</sup> P: Reglamento panameño 351 Concentraciones máximas permisibles en el agua potable (1999); AO: Objetivo estético.

0.3 - denota una excedencia por encima de los criterios asociados a la salud humana.

CCME: Consejo Canadiense de Ministros del Medio Ambiente, Lineamientos Canadienses para la Salud Humana para la Calidad del Agua Potable en Canadá (2008); ORNL: Niveles de análisis del agua del grifo del Oak Ridge National Laboratory para contaminantes químicos en sitios del Superfondo (lineamientos ajustados para reflejar un ILCR de 10-5, HQ de 0.2) (Septiembre 2008).

Tabla 10 Tabla de Análisis de Calidad de Agua Dulce de Línea Base para la Evaluación de Riesgos a la Salud Humana en el Área de Estudio del Enfoque Ecosistémico (AEEE)

<sup>(a)</sup> Basado en los criterios definidos en Golder (2007): Proyecto Petaquilla – Revisión de la calidad del agua de parte de los reguladores.

<sup>(b)</sup> En los cálculos estadísticos, se utilizó un valor de la mitad del límite de detección.

<sup>(c)</sup> P: Reglamento panameño 351 Concentraciones máximas permisibles en el agua potable (1999);

AO: Objetivo estético

**0.3** - denota una excedencia por encima de los criterios seleccionados asociados a la Salud Humana.

CCME: Consejo Canadiense de Ministros del Medio Ambiente, Lineamientos Canadienses para la Salud Humana para la Calidad del Agua Potable en Canadá (2008);

ORNL: Niveles de análisis del agua del grifo del Oak Ridge National Laboratory para contaminantes químicos en sitios del Superfondo (lineamientos ajustados para reflejar un ILCR de 10-5, HQ de 0.2) (Septiembre 2008).

<sup>(a)</sup> Basado en los criterios definidos en Golder (2007): Proyecto Petaquilla – Revisión de la calidad del agua de parte de los reguladores.

<sup>(b)</sup> En los cálculos estadísticos se utilizó un valor de la mitad del límite de detección.

<sup>(c)</sup> P: Reglamento panameño 351 Concentraciones máximas permisibles en el agua potable (1999);

AO: Objetivo estético

**0.3** - denota una excedencia por encima de los criterios seleccionados asociados a la Salud Humana.

CCME: Consejo Canadiense de Ministros del Medio Ambiente, Lineamientos Canadienses para la Salud Humana para la Calidad del Agua Potable en Canadá (2008);

ORNL: Niveles de análisis del agua del grifo del Oak Ridge National Laboratory para contaminantes químicos en sitios del Superfondo (lineamientos ajustados para reflejar un ILCR de 10-5, HQ de 0.2) (Septiembre 2008).
